**Listeria infection**

**Cook foods thoroughly**
- Listeria bacteria are killed by heating, so cook all foods thoroughly.
- Before eating, reheat high risk or leftover food until it is steaming hot all the way through.

**Keep foods chilled**
- Listeria bacteria can survive and grow at low temperatures. Keep your fridge as cold as possible (below 5 °C) without freezing the food.
- Refrigerate all food, including leftovers, as soon as the food is cool enough to touch.
- Throw out food left at room temperature for long periods (over four hours), especially in summer.
- Defrost frozen food in your fridge or microwave, rather than on a bench at room temperature.

**What are high risk foods?**
Many ready-to-eat foods are considered high risk foods for Listeria infection. This is because these foods are sometimes contaminated with Listeria bacteria during or after the manufacturing process and the bacteria can continue to grow at refrigerator temperatures.

People at risk of Listeria infection should avoid the following foods:
- paté
- cold ready-to-eat chicken
- manufactured ready-to-eat meats, including polony, ham and salami
- soft cheeses, including brie, camembert, fetta and ricotta
- pre-packed, pre-prepared or self-serve fruit or vegetable salads
- freshly squeezed fruit and vegetable juices
- ready-to-eat cold, smoked or raw seafood, including smoked salmon, oysters, sashimi and cooked prawns
- sushi
- soft serve ice cream and thick shakes
- tofu, both soft and hard types, and tempeh
- unpasteurised milk and unpasteurised milk products.

**Further information**
If you are unwell contact your doctor or healthdirect Australia on 1800 022 222 (24 hours a day, seven days a week).

What is Listeria infection?
Listeria infection (also known as listeriosis) is a rare but potentially severe illness caused by Listeria monocytogenes bacteria.

How do you get Listeria infection?
Listeria infection is caused by eating food that contains Listeria monocytogenes bacteria. These bacteria are widespread in the environment and can sometimes contaminate certain high risk foods that have not been thoroughly cooked or properly prepared or stored (for more information see the list of high risk foods listed in this brochure). Listeria infection is not normally transmitted between people, although it can pass from a pregnant woman to her unborn baby.

Who is at risk?
Listeria infection is uncommon in healthy people. Those at greater risk of infection include:
- pregnant women and their unborn or newborn babies, and
- people whose immune system has been weakened due to chronic illness including cancer, diabetes, alcoholism, or medications that impair immunity such as steroids and anti-cancer drugs.

Ask your doctor for more information if you are concerned that you are at risk.

What are the symptoms and health impacts?
Symptoms vary but may include:
- fever and chills
- headache
- stiff neck and sensitivity to light
- confusion and drowsiness
- muscle aches and pains
- nausea
- diarrhoea.

Symptoms usually occur around three weeks after eating contaminated food but the interval can vary between a few days and two months.

Healthy people and pregnant women may have mild or no symptoms, but Listeria infection may still result in miscarriage, premature birth or stillbirth.

In people at risk, Listeria infection can result in serious illnesses including meningitis (infection of the membrane surrounding the brain and spinal cord) and septicaemia (blood infection that can spread through the body). Babies born with Listeria infection can develop septicaemia or meningitis.

If you are pregnant or have a weakened immune system and develop symptoms consistent with Listeria infection, see your doctor as soon as possible.

How do I get treated?
People with Listeria infection usually require hospitalisation and treatment with intravenous antibiotics.

How can I reduce the risk of Listeria infection?
You can reduce the risk of infection by avoiding high risk foods and preparing and storing food safely as follows:

Be clean
- Always wash your hands, knives and chopping boards with warm, soapy water before and after handling raw foods, and between handling different kinds of food.
- Keep your fridge clean and clean up any spills.
- Listeria bacteria can be found on fruit and vegetables grown in soil. Wash fruit and vegetables, including herbs, especially before eating them raw.

Keep foods separate
- Keep raw food separate from cooked and ready-to-eat food.
- Use separate cutting boards and knives for each type of food and especially for raw, cooked and ready-to-eat foods.
- Always wrap or cover food to prevent it being contaminated by bacteria.
